

- Discord Meeting:
 - Daily updates (Oct 19th):
 - Tara: worked on some endpoint work for interactions with posts while traveling back home. The format for them is already defined, which should allow for Qiwen to start working on the frontend without any big surprises coming up.
 - Qiwen: The UI work for refactoring the website was about 85% complete. There are some bugs still present in the UI in terms of functionality (such as load more) but they have all been documented and assigned accordingly.
 - Kelly: Still working on refactoring the UI logic. Since the post cards, friend cards, and request cards all pretty much use the same code, making a general card list adapter and helper instead will be beneficial to reduce code duplication. Will be continuing work on it for the rest of the day.
 - Cynthia: Took a look at the open PRs and made a few change requests since there were some bugs, such as being unable to see the full preview of the top post on the public posts page. We should probably remove the search bar, as we do not have a core feature that will implement any search functionality. We only have a trimmable feature that is implementing a tag search, but we definitely won't have time for that. This also goes for the mobile, just in case it was added during mobile refactoring.
 - Other discussion:
 - Mobile UI progress:
 - Lots more progress, it's just taking a while since we have other classes taking precedence.
 - Some of the words in the mobile UI are leaking off the screen and we should probably fix this as it's one of the obvious bugs that Kiarash mentioned.
 - This can probably just be fixed within the XML file since it was possible before the refactoring.
 - Same goes for how the text for the date is rendered on the screen.

- This may require a custom converter, but there may be a built-in function that can handle this.
- The long title or body ended up just being abruptly cut off. We should cut them off with a trailing ... to show that there's more to the message than what is being displayed.
- Diary entry posts:
 - We forgot to include dev tasks for being able to comment on diary entries.
 - This shouldn't be much more front-end work, and next to no backend work with how posts are set up.
 - Should all comments on the diary entries be anonymous?
 - By nature, we always want the comments to be anonymous. It's a big part of our project to have it always be anonymous for comments, despite the OP being able to show their username to their friends.
 - It makes it simpler on the frontend and backend to have all comments be anonymous.
 - We still want to keep track of who made the comment so that they can edit it, but it won't need to be displayed on the frontend at all.
 - This is how it's designed in the backend already :)
- Displaying comments:
 - What do we think about having a separate page to display all of the comments a user has made?
 - The original plan was to just show it on the same page as "MyPosts" but this might be confusing.
 - But we can definitely show it on a different page.
- Daily Updates (Oct 20th):
 - Tara: For the next few days: Working on finishing up the endpoints in the local branch, and writing unit/integration tests for them along the way so that a big PR can get in for Kelly to review. If that isn't done by EOD today, it'll be worked on tomorrow, but there's a

term test on Tuesday to study for. Will finish up testing on Tuesday after the test. Wednesday is probably just implementing more of the endpoints and getting as much progress as possible for the other user stories of this feature.

- Qiwen: Addressing PR concerns and putting in a new update. Unfortunately the top posts are still being cut off, but it was fixed in a separate commit.
- Cynthia: Doing some work in Postman to test Tara's code. Came across a few problems but talked with Qiwen and was able to fix the problem! Relayed information to Tara to make sure her Postman runs appropriately for testing.
- Kelly: Putting in a new PR for the mobile refactoring!!
- October 21st:
 - Reply to comment:
 - Going over what we had discussed at the beginning of our project in terms of being able to reply to comments.
 - Implementing actual threads like on reddit would be pretty convoluted and computationally confusing, so we decided to just let it sort the comments chronologically. A "thread" could technically still be done by just using timestamps, so we left it like this.
 - As long as we have a reason to justify our decision, we should be good! Better to keep it easier than more complex. We're not implementing an exact replica ;)
 - VM setup for CI/CD:
 - We got donowalled...
 - Tara sent another email to the entire thread in hopes of getting more details about the VM.
 - Identical Functionality:
 - Should mobile and web have the exact same functionality? Because changing the password on mobile wasn't too great.
 - This means that we can just tell our users to change their password only on the website. This can be stressed as a feature, not a bug.
- Action Items:
 - Fix mobile posts from falling off the edge.

- Add a dev task for showing comments on diary entries.
- Finish working on endpoints for comments.
- Finish bug fixes.
