

- Discord meeting:
  - There was still some miscommunication regarding what tables and environment the backend should be pointing to, which was resolved
  - Some issues appear when implementing votes in the frontend
    - Because of the slow API response, the UI doesn't update immediately and also creates the possibility of multiple upvotes if clicked quickly enough
    - Limited availability of the vote buttons on mobile to the full-page view of a post
  - Some weird bug appeared with the mobile app, where the votes won't work with the first launch of the app in Android Studio
    - We have no idea how to fix this since it works after restarting and then the issue can't be replicated afterwards
- Action items:
  - Write notes in the slides for the Technique Sharing Presentation
  - Continue working on bug fixes and feature implementation
