

- Discord meeting:
 - Cynthia brought up removing a parameter from the `getPostsByUser` endpoint at some point in the future since it was not being used at that point
 - Small daily check-in (1st):
 - Cynthia: finished viewing friends diary entries on the website, still working on the same view for mobile
 - Tara: finishing up tests for `getDiariesByUser` and `getDiariesByFriends` endpoints, still working on one that continuously fails
 - Kelly and Qiwen: working on getting the Jenkins server working smoothly
 - Branch clean-up
 - Kelly had issues running tests locally, which had been a small problem throughout sprint 2 where the time waiting for an object to be created in the database wouldn't be long enough
 - So only sometimes the integration tests would fail
 - Kelly fixed the issue after help from Qiwen
 - We found out the the disk space of the VM we're using for Jenkins was too small
 - Qiwen tried a few ways to free up space, but nothing was working
 - This eventually caused the Jenkins server to shut down
 - Kelly emailed the support staff to find a fix for this problem
 - We got an email back recommending to switch the directory we were using in the VM, which allowed us to have enough room to run the Jenkins server
 - All dev task issues were closed after Nov 2nd once Tara and Cynthia finished their work
 - This only leaves the worksheet left to do
- Action items:
 - Delete branches that aren't being used anymore
 - Merge any branches into dev that need to be saved
 - Add to "show off" section of the worksheet
