

- Discord Meeting:
  - Remaining PRs:
    - There are quite a few PRs waiting to be merged into dev now, and they need to be merged in so that we can ensure that our branches do not cause conflicts.
    - The PR of most importance is the one where we changed everything from username to uid.
    - Once everyone reviewed it, we merged it in and now have to ensure our other open PRs were no longer conflicting and actually still worked as intended.
    - Other PRs were merged in to keep dev going swiftly. We communicated as a team that it would be best to tackle them asynchronously whenever someone has the chance instead of it just being one person assigned to it.
  - Acceptance tests:
    - All of them have been completed for the residuals from Sprint 1.
  - Mobile PR:
    - Another PR for finishing Sprint 1 residuals went up without the password reset. We left a link going to the website instead of fighting with mobile and Cognito.
  - Integration test flakiness:
    - They were failing on Tara's PC when running it normally, but they were all passing when she ran it in debugging mode. Other group members tried running it from her branch and they were running normally.
      - This makes it impossible for her to even try to debug the issue since the debugger just makes all of the tests succeed...
    - We concluded that it's a hardware issue(?) and to keep an eye on it when setting up CI/CD.
- Action Items:
  - Merge any new PRs into dev as soon as they come up when you get the chance instead of waiting for the designated person.
  - Continue working on frontend development.
  - Keep an eye on the integration tests going forward, especially once we've set up CI/CD. If it causes issues, we may need to introduce delays in our code to ensure users are being created accordingly.
