

- User capacity features
 - Can start as non-technically, and slowly flesh out the feature as we progress through the project
 - Ideas
 - A new user should be able to make an account within 5 minutes
 - A new user should be able to create a public post within 5 minutes
 - A new user should be able to create a diary entry within 5 minutes
- Project work decision
 - Game plan is to form 2 groups of 2 people working on a feature for each sprint
 - Emphasis on fair time estimates
 - Should be divided evenly between everyone, no matter how the work is divided for fairness
 - Time estimates will probably vary between different members of the group, which is another element to keep in mind when dividing work
 - Can use Cynthia's spreadsheet + GitHub time estimates to plan this out further
 -  Comp 3350 Group Project Iteration 3
 - We should also do our best not to complete someone else's work for fairness unless absolutely necessary (and even in these cases, it should be discussed first)
 - More details to discuss on Friday, Sept 20th
- Other notes:
 - Tara - As we discussed in the deliverables channel for Iteration 0, I wanted to just have this listed/discussed somewhere else. We may need to have another table/object to outline the votes that a post/user has. This would facilitate queries we'd need to make and reduce the amount of queries that would be run, hopefully increasing the efficiency of our application. This wasn't included in the HLA as I believed that it could've caused some confusion for an initial proposal and dives too deep into our implementation details, which should always be abstracted from an HLA.
